The George Propane Tank Monitoring System

How does it work?

The Tank Monitoring System consists of a transmitter connected directly to your propane tank. Several times a month the transmitter notifies George Propane to let us know how much propane you have in your tank. The transmitter also notifies George Propane when the propane tank level falls below a predetermined set point, greatly reducing the chance of an out-of-gas or freeze-up event at your home or business. In addition to notifying George Propane, you can also be contacted via Fax or E-mail. You may also view the status of your propane tank level on the internet at any time.

Is it reliable?

Yes. We researched and field tested several models before deciding on Centeron by Robertshaw, a worldwide leader in automation and controls for over 50 years.

I'm on Automatic Refill. Why would I want a tank monitor?

- Our goal is to provide the best possible service at an affordable price. To meet this goal, George Propane needs to be as efficient as possible.
- By installing a monitor, you help us deliver the optimal amount of propane to your tank, increasing our efficiency, lowering our cost and yours.
- Our customers' usage patterns sometimes change. Simply adding a gas appliance such as a decorative hearth product, hot water heater, space heater, pool heater, barbecue grill or generator can increase fuel usage, causing you to run out of fuel if we are not notified. Discontinuing use of wood or pellet-burning stoves can also have the same result.
- Sometimes winter weather prevents us from making a delivery. With a monitor, we can be sure your delivery arrives when you need it most.
- You can go away for a long weekend or winter vacation, feeling assured that your tank level is monitored and that we'll be notified if it falls below the set point.

How do I sign up?

Call George Propane at (413) 268-8360 or email us at info@georgepropane.com.
